Thermal Data

Parameter	Symbol	Typical	Maximum	Unit
Thermal Resistance, Junction-to-case	$R_{\theta JC}$	1.4	1.6	$^\circ\text{C}/\text{W}$
Thermal Resistance, Junction-to-ambient, $t \leq 10\text{s}$ (Note 2)	$R_{\theta JA}$	15	18	
Thermal Resistance, Junction-to-ambient, steady state (Note 2)		40	50	

- Note : 1. The power dissipation P_D is based on $T_{J(\text{MAX})}=175^\circ\text{C}$, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.
2. The value of $R_{\theta JA}$ is measured with the device mounted on 1 in² FR-4 board with 2 oz. copper, in a still air environment with $T_A=25^\circ\text{C}$. The power dissipation P_{DSM} is based on $R_{\theta JA}$ and the maximum allowed junction temperature of 150°C . The value in any given application depends on the user's specific board design, and the maximum temperature of 175°C may be used if the PCB allows it.
3. Repetitive rating, pulse width limited by junction temperature $T_{J(\text{MAX})}=175^\circ\text{C}$. Ratings are based on low frequency and low duty cycles to keep initial $T_J=25^\circ\text{C}$.
4. The maximum current limited by package is 56 A.
5. The static characteristics are obtained using $<300\mu\text{s}$ pulses, duty cycle 0.5% maximum.
6. The $R_{\theta JA}$ is the sum of thermal resistance from junction to case $R_{\theta JC}$ and case to ambient.
