

Adjustable shunt regulator

TL432A3/N3/M3/K3

Description

The TL432 is a three terminal adjustable shunt regulator with thermal stability guaranteed over temperature. The output voltage can be adjusted to any value from 1.24V (V_{REF}) to 18V with two external resistors. The TL432 has a typical dynamic output impedance of $0.2\ \Omega$. Active output circuitry provides a very sharp turn on characteristic, making the TL432 an excellent replacement for zener diodes. The TL432 shunt regulator is available with two voltage tolerances (0.5%, and 1%), and four package options (TO-92, SOT-23, SOT-89 and TO-92L). This allows the designer the opportunity to select the optimum combination of cost and performance for their application.

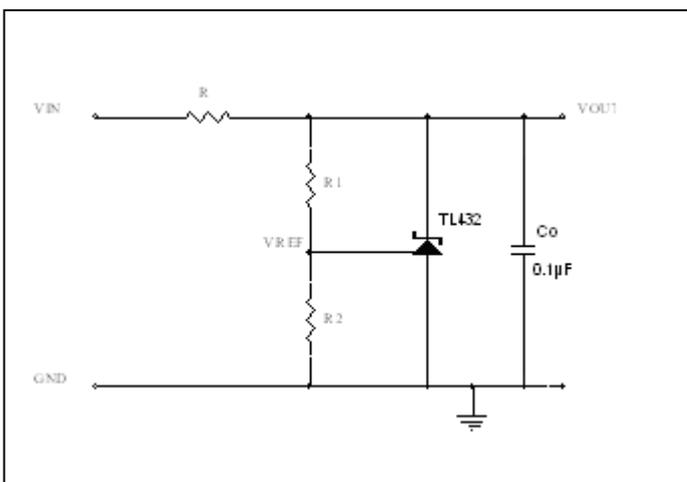

Features

- ◆ Low voltage operation (down to 1.24V)
- ◆ Fast turn on response
- ◆ Low dynamic output impedance $0.2\ \Omega$ typ.
- ◆ Trimmed bandgap design : $\pm 0.5\%$
- ◆ Sink current capability : 100mA
- ◆ Available in TO-92, SOT-23, SOT-89, and TO-92L packages

Applications

- ◆ Linear Regulators
- ◆ Adjustable Supplies
- ◆ Switching Power Supplies
- ◆ Battery Operated Computers
- ◆ Instrumentation
- ◆ Computer Disk Drives

Typical Application Circuit (Note 1,2)

Notes:

- 1) Set V_{OUT} according to the following equation:

$$V_{OUT} = V_{REF}(1 + R1/R2) + I_{REF}R1$$
- 2) Choose the value for R as follows:
 - The maximum limit for R should be such that the cathode current, I_z , is greater than the minimum operating current ($80\ \mu A$) at $V_{IN(MIN)}$.
 - The minimum limit for R should be as such that I_z does not exceed 100mA under all load conditions, and the instantaneous turn-on value for I_z does not exceed 150mA. Both of the following conditions must be met:

$$R_{min} \geq V_{IN(max)} / 150mA \text{ (to limit instantaneous turn-on } I_z)$$

$$R_{min} \geq \frac{V_{IN(max)} - V_{OUT}}{I_{OUT(min)} + 100mA} \text{ (to limit } I_z \text{ under normal operating conditions)}$$

Applications Information - Stability

Selection of load capacitance when using TL432 as a shunt regulator

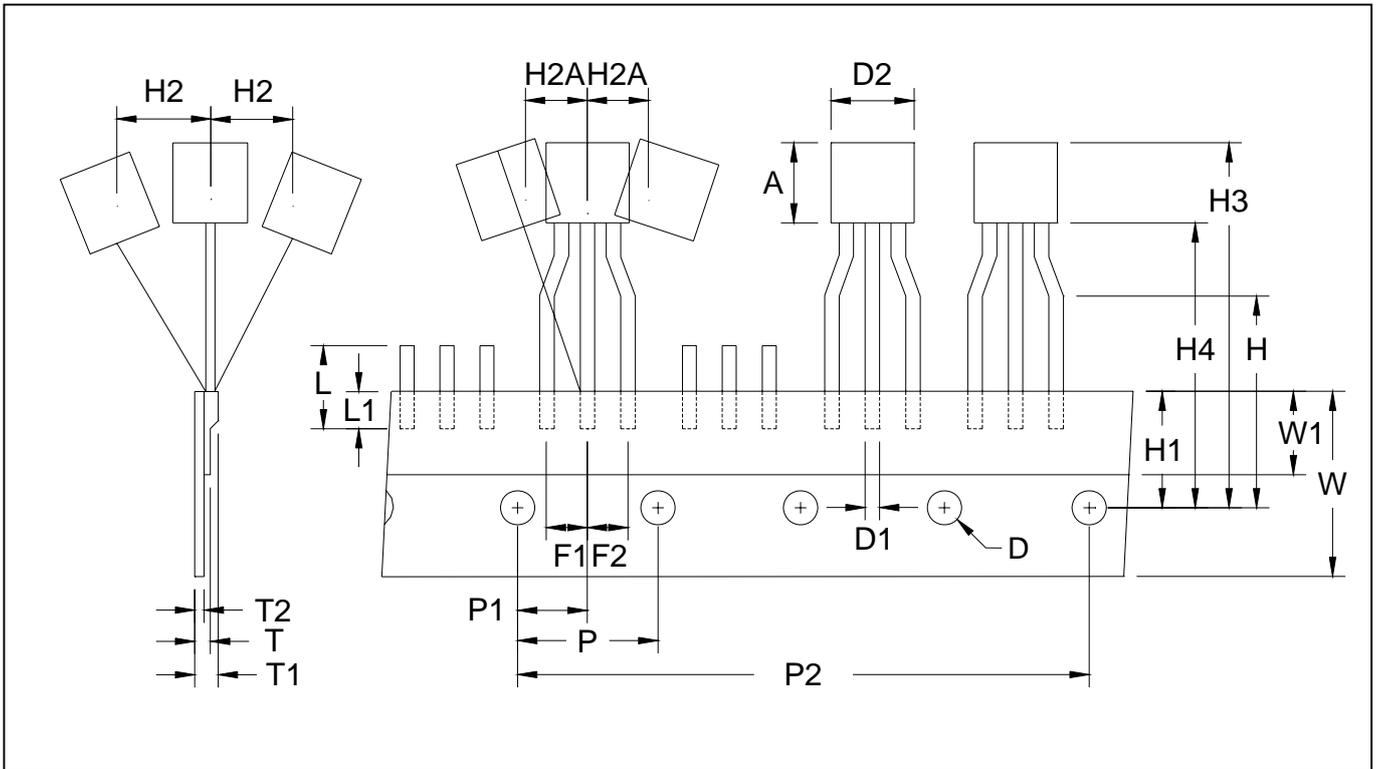

When the TL432 is used as a shunt regulator, two options for selection of C_L (see diagram on page 6) are recommended for optimal stability:

- 1) No load capacitance across the device, decouple at the load.
- 2) Large capacitance across the device, optimal decoupling at the load.

The reason for this is that TL432 exhibits instability with capacitances in the range of 10nF to 1µF (approx.) at light cathode currents(up to 3mA typical). The device is less stable the lower the cathode voltage has been set for. Therefore while the device will be perfectly stable operating at a cathode current of (say) 10mA with a 0.1µF capacitor across it, it will oscillate transiently during start-up as the cathode current passes through the instability region. Selecting a very low (or preferably, no) capacitance, or alternatively a high capacitance(such as 10µF) will avoid this issue altogether. Since the user will probably wish to have local decoupling at the load anyway, the most cost effective method is to use no capacitance at all directly across the device. PCB trace/via resistance and inductance prevent the local load decoupling from causing the oscillation during the transient start-up phase.

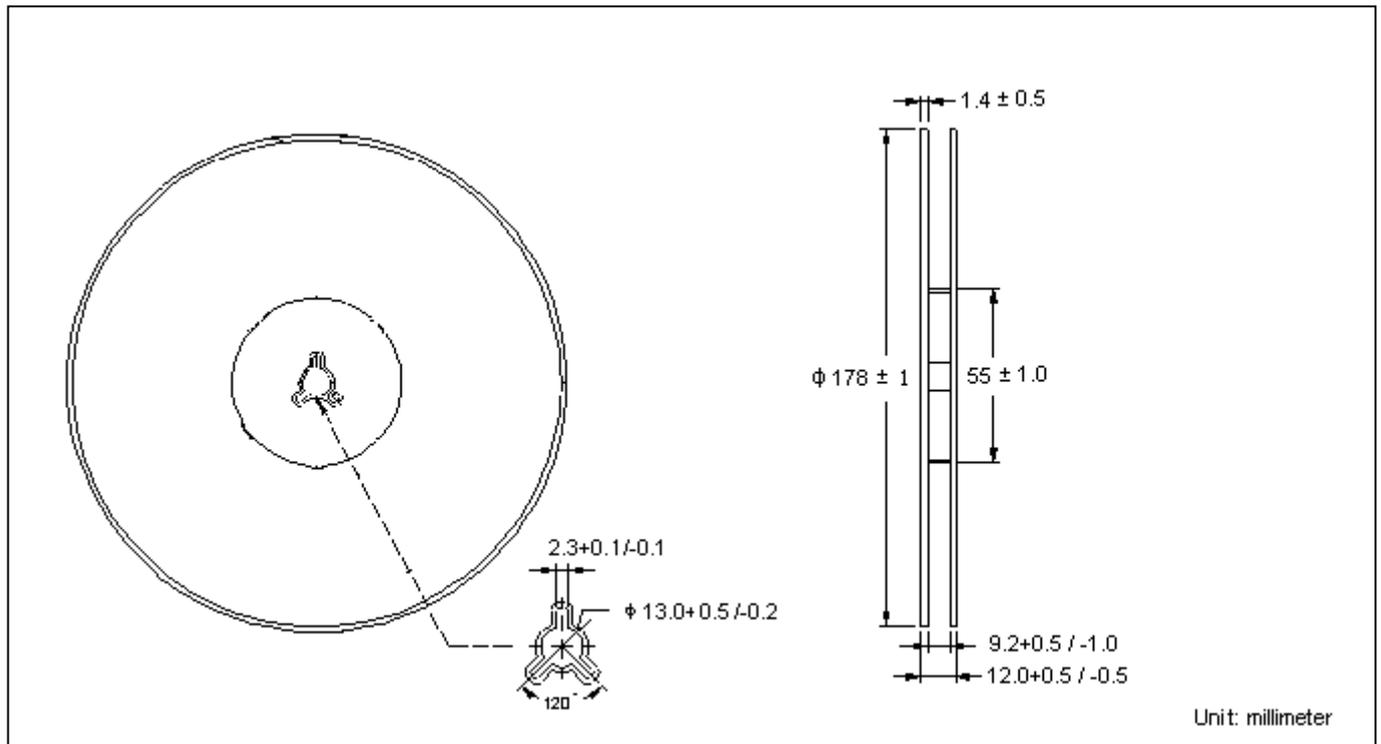

Note : if the TL432 is located right at the load, so the load decoupling capacitor is directly across it, then this capacitor will have to be $\leq 1\text{nF}$ or $\geq 10\mu\text{F}$.
